1.0 Introduction to backup and restore

Backup and recovery describe the process of creating and storing copies of data that can be used to protect organizations against data loss referred to as operational recovery. Recovery from a backup typically involves restoring the data to the original location, or to an alternate location where it can be used in place of the lost or damaged data.

- A proper backup copy is stored in a separate system or medium from the primary data to protect against the possibility of data loss due to hardware or software failure.
- Click on the settings menu from the main menu.

• The list of settings will open. Click on the "backup and restore" from the list
